***Allowable Subject Matter***

1. Claims 1-18 are allowed.
2. The following is a statement of reasons for the indication of allowable subject matter:

Applicants have amended the claims in accordance to the office action dated 03/28/05. The present invention relates to improved method and apparatus of separating simultaneous signal in a single channel at the receiving side including the use of first and second fast Fourier transform connected in cascade order and "a digital filter bank receiving output from said second fast Fourier transform"; "eliminating the digital filter bank output by comparing to a preselected threshold and a plurality of narrow-band monobit receivers for receiving signals output from said digital filter bank and of a greater value than said preselected threshold and further, said plurality of narrow-band receivers receiving only the highest two bits from real and imaginary parts of said signal output from said digital filter bank and of a greater value than said signal eliminating threshold", as claimed, in independent claim 1 and similarly in independent claims 11, 12 (claims 2-10, 13-18 depend therefrom). Conventional approach to building a wideband digital receivers is known to use a polyphase filter to slowdown the operation speed of the fast Fourier transform. However, prior art of record, taking individually or collectively, fails to fairly teach such receiving method and apparatus including the particular claimed subject matter. Thus, claims 1-18 are found to be novel and unobvious over prior art of record.
